选择模型时需要domain knowledge

Model 模型 $y = b + wx_1$ based on domain knowledge

y: no. of views on 2/26, x_1: no. of views on 2/25 **feature** 特征

w and b are unknown parameters (learned from data) 参数

weight 权重 **bias** 偏置

2. Define Loss from Training Data

- Loss is a function of parameters $L(b, w)$
- Loss: how good a set of values is.

$L(0.5k, 1)$ $\quad y = b + wx_1 \longrightarrow y = 0.5k + 1x_1$ How good it is?

Data from 2017/01/01 – 2020/12/31

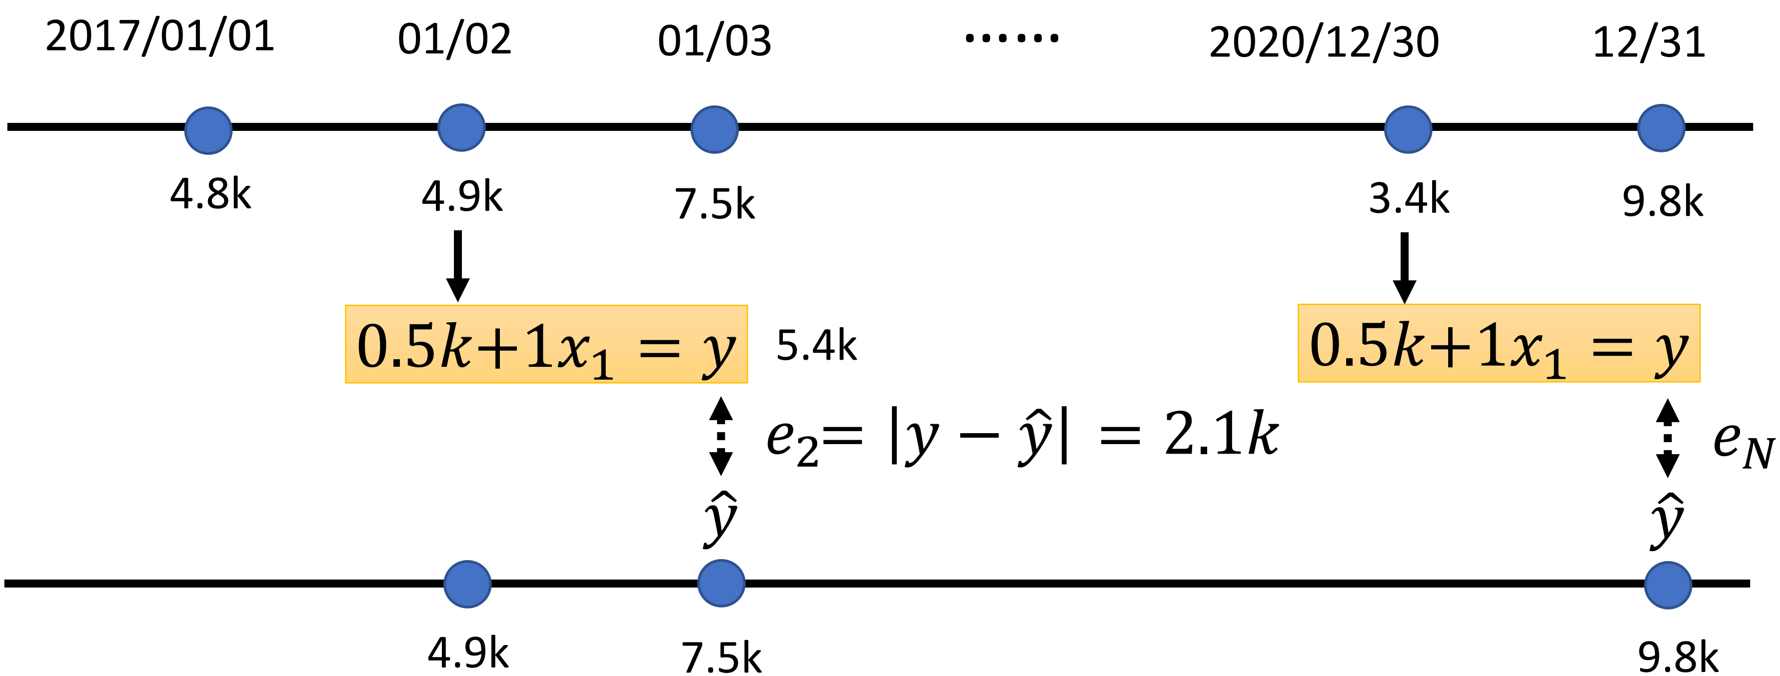
2. Define $\boxed{\text{Loss}}$ from Training Data

- Loss is a function of parameters $L(b, w)$
- Loss: how good a set of values is.

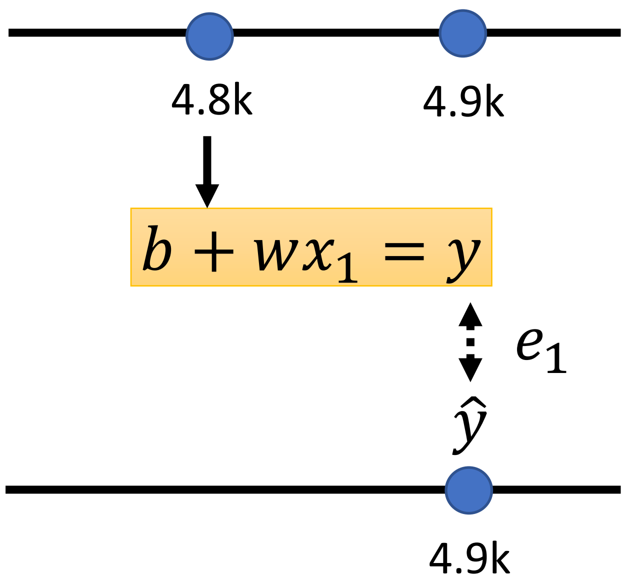
$L(0.5k, 1)$ $\quad y = b + wx_1 \longrightarrow y = 0.5k + 1x_1$ How good it is?

Data from 2017/01/01 – 2020/12/31



2. Define Loss from Training Data

- Loss is a function of parameters $L(b, w)$
- Loss: how good a set of values is.



Loss: $$L = \frac{1}{N}\sum_n e_n$$

$e = |y - \hat{y}|$ L is mean absolute error (MAE)

$e = (y - \hat{y})^2$ L is mean square error (MSE)

If y and $\hat{y}$ are both probability distributions → Cross-entropy

2. Define Loss from Training Data

- Loss is a function of parameters $L(b, w)$
- Loss: how good a set of values is.

w^* [redacted] $= arg \min_{w}$ [redacted] L

简化起见，假设我们只有一个参数

Gradient Descent

- (Randomly) Pick an initial value w^0

- Compute $\frac{\partial L}{\partial w}|_{w=w^0}$ 计算微分（切线斜率）

Negative → Increase w

使loss变小

Positive → Decrease w

$$w^1 \leftarrow w^0 - \eta \frac{\partial L}{\partial w}|_{w=w^0}$$

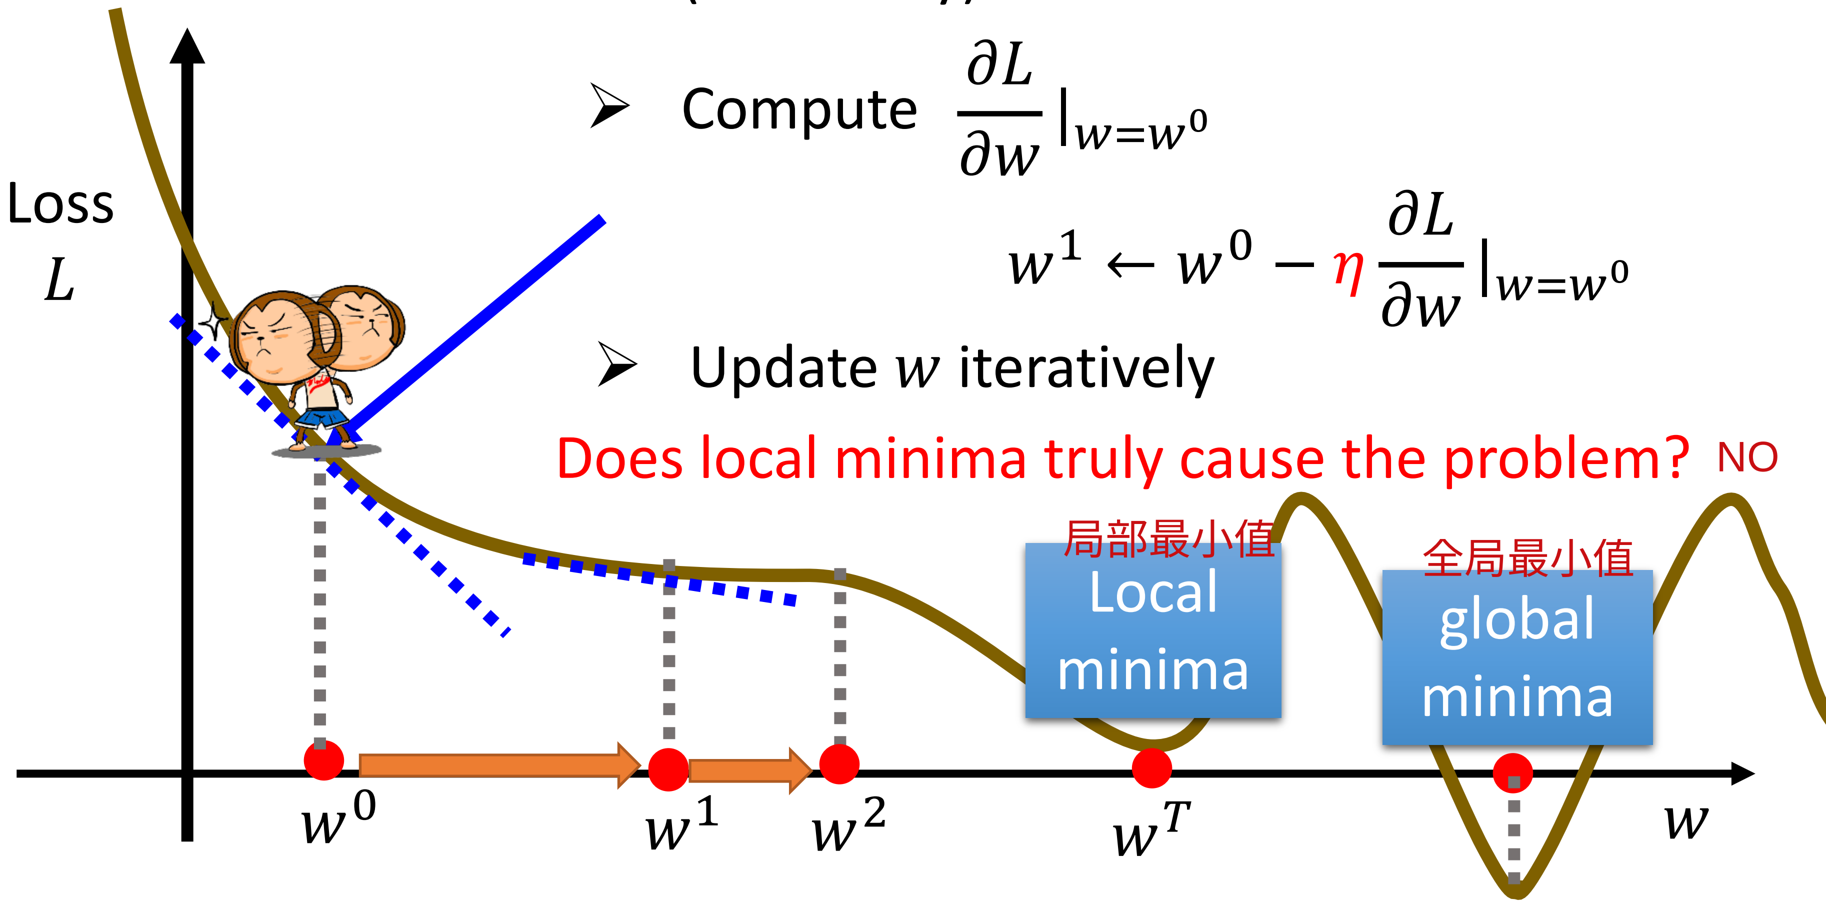
Gradient Descent

- (Randomly) Pick an initial value w^0
- Compute $\frac{\partial L}{\partial w}|_{w=w^0}$

$$w^1 \leftarrow w^0 - \eta \frac{\partial L}{\partial w}|_{w=w^0}$$

- Update w iteratively

Does local minima truly cause the problem? NO



This page：把Gradient Descent推广到两个参数

3. Optimization

$$w^*, b^* = arg \min_{w,b} L$$

- (Randomly) Pick initial values w^0, b^0
- Compute

$$\boxed{\begin{array}{l} \frac{\partial L}{\partial w}|_{w=w^0,b=b^0} \\ \\ \frac{\partial L}{\partial b}|_{w=w^0,b=b^0} \end{array}}$$

$$w^1 \leftarrow w^0 - \eta \frac{\partial L}{\partial w}|_{w=w^0,b=b^0}$$

$$b^1 \leftarrow b^0 - \eta \frac{\partial L}{\partial b}|_{w=w^0,b=b^0}$$

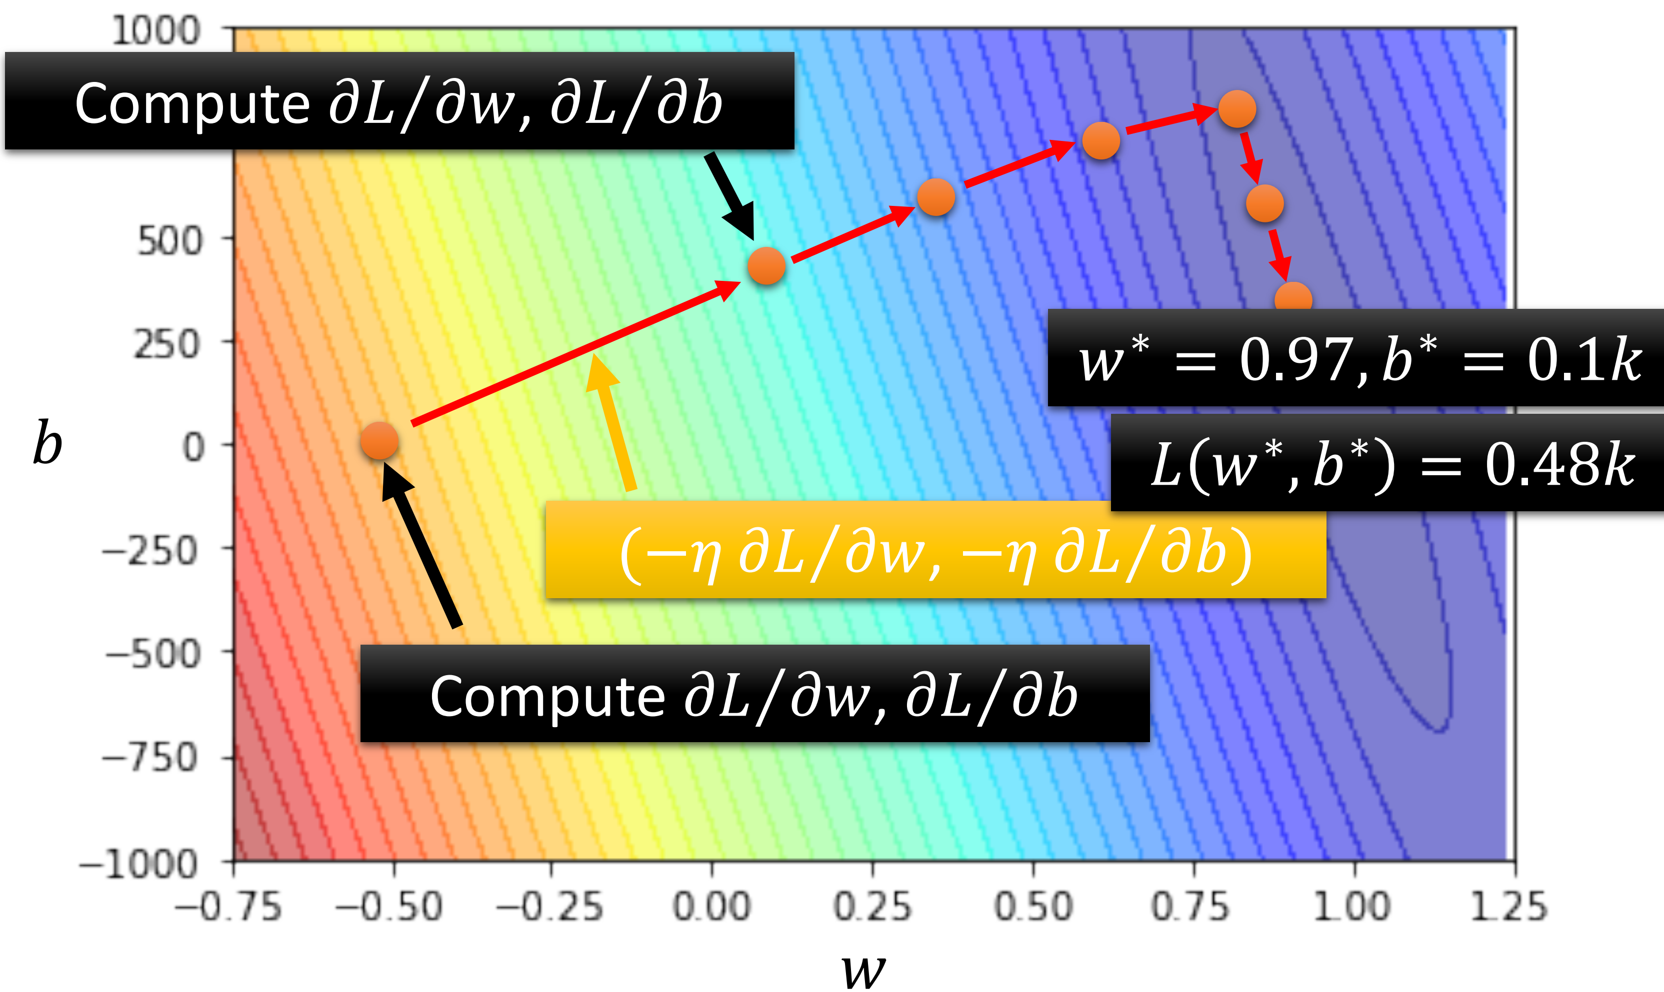
Can be done in one line in most deep learning frameworks

- Update w and b interatively

3. Optimization

Model $y = b + wx_1$

$$w^*, b^* = arg\min_{w,b} L$$



Machine Learning is so simple ……

$$y = b + wx_1$$

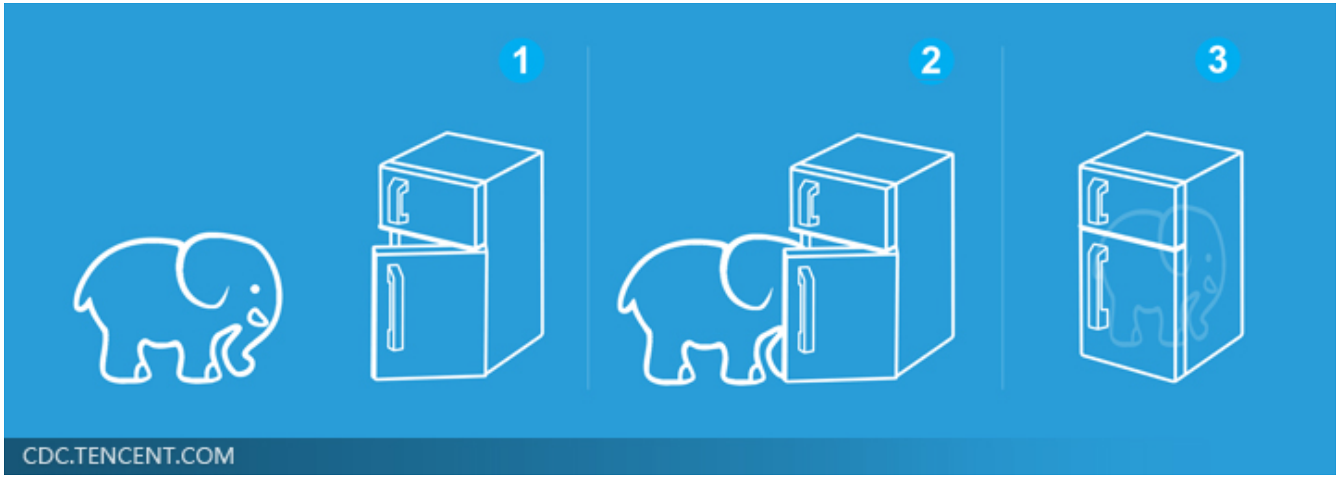
Step 1: function with unknown

Step 2: define loss from training data

$$w^* = 0.97, b^* = 0.1k$$

$$L(w^*, b^*) = 0.48k$$

Step 3: optimization



Machine Learning is so simple ……

$$w^* = 0.97, b^* = 0.1k$$

$$y = b + wx_1 \qquad L(w^*, b^*) = 0.48k$$

$y = 0.1k + 0.97x_1$ achieves the smallest loss $L = 0.48k$ on data of 2017 – 2020 (**training data**) 训练集

How about data of 2021 (**unseen during training**)?

考虑28天（1月）

$$y = b + \sum_{j=1}^{28} w_j x_j$$

2017 - 2020 $L = 0.33k$

2021 $L' = 0.46k$

考虑56天（2月）

$$y = b + \sum_{j=1}^{56} w_j x_j$$

2017 - 2020 $L = 0.32k$

2021 $L' = 0.46k$
